

The Vasquez Boulevard and Interstate 70 Superfund Site is considered “Current Human Exposure Not Under Control” because of direct exposure to arsenic and lead contaminated soils for those properties where access was not granted for sampling and/or cleanup. In those properties where consent for access was not granted, institutional controls (ICs) are not in place as a form of notification for properties that changed ownership or may change ownership in the future.

As of October 2010, the planned activities planned to address this pathway are agreements between the State, City & County of Denver (CCoD), and EPA regarding the type of ICs, an ESD, and one last opportunity for sampling and/or cleanup for those properties that did not allow consent for access.

As of March 2010, a series of meetings have been initiated between the EPA and State to determine the type of ICs that may be appropriate as a form of notification.
